Exercise 4. SQL injections: evading filtering

SQL injection is very common vulnerability in Internet. In this laboratory you learn basics of SQL-injections. Commonly web-application firewalls are used to protect applications from malicious queries
.
It this laboratory exercise you are going to try to evade different input filters.

Do following steps to start your laboatory:
1. Download a special xampp from http://users.metropolia.fi/~kimmosa/xampp-attack.zip
2. Extract and go to directory xampp
3. Run setup-xampp.bat (this will take care of right path for the software)
4. Run xampp_start.exe
5. Open Firefox and browse to http://localhost/lab-2-IDS/lab1

In the left you have the familiar query box (from previous lab) and in the right you can see the web-application firewall output. The firewall does not block malicious data into SQL-server for practice purpose, but ofcourse it could easily do that in real environment.
